Neurology Clinical Cases Uncovered

The sensory system provides information that places the individual in relation to the environment. Sensation may be classified into categories by various methods dependent on anatomic or functional criteria. An anatomic classification divides sensory function into somatic and visceral components with general and special subgroups of each. Clinically, however, only somatic sensation is easily ...

Schizophrenia is a mental health disorder characterized by a difficulty in differentiating between what is and is not real. People with schizophrenia are more likely to experience insomnia and circadian rhythm disorders. Sleeping problems may be exacerbated by medications that are used to treat schizophrenia. Poor sleep and symptoms of schizophrenia may be mutually reinforcing, so there are ...
